The first of these is the fact that the
 population of the country is increasing
 rapidly. This is due to a number of
 causes, the most important of which
 are the following: (1) the high birth
 rate, (2) the low death rate, and (3)
 the immigration of large numbers of
 people from other countries. The result
 of these causes is that the population
 of the country is now about 100 million
 people, and is increasing at the rate
 of about 1% per year. This is a very
 rapid rate of increase, and it is
 likely to continue for many years to
 come. The second of the causes
 mentioned above is the fact that the
 death rate is low. This is due to a
 number of factors, the most important
 of which are the following: (1) the
 improvement in medical science, (2) the
 improvement in sanitation, and (3) the
 improvement in the general standard
 of living. The result of these factors
 is that the death rate is now very low,
 and is likely to continue to be so for
 many years to come. The third of the
 causes mentioned above is the fact
 that large numbers of people are
 immigrating into the country from
 other countries. This is due to a
 number of factors, the most important
 of which are the following: (1) the
 search for better living conditions,
 (2) the search for political freedom,
 and (3) the search for economic
 opportunity. The result of these factors
 is that large numbers of people are
 immigrating into the country, and this
 is likely to continue for many years to
 come.

The first part of the paper is devoted to a discussion of the
 various methods of determining the rate of reaction. The
 most common method is the use of a clock reaction, in which
 the time taken for a certain amount of product to be formed
 is measured. This method is only applicable to reactions which
 are first order with respect to one of the reactants. The
 rate of reaction can also be determined by measuring the
 change in concentration of one of the reactants or products
 over a given time interval. This method is applicable to
 reactions of any order. The rate of reaction can also be
 determined by measuring the change in pressure or volume
 of a gas during the reaction. This method is only applicable
 to reactions which involve a change in the number of moles
 of gas. The rate of reaction can also be determined by
 measuring the change in color of a solution during the
 reaction. This method is only applicable to reactions which
 involve a change in color.

Handwritten text in a script, likely Devanagari, on a long, narrow strip of paper. The text is arranged in approximately 10 horizontal lines.
